Customer Service Performance & Retention Analysis

Made with GAMMA

BUSINESS CONTEXT

Understanding Flipkart's Retention Challenge

Flipkart stands as one of India's premier e-commerce platforms, serving millions of customers across diverse product categories—from electronics to fashion, home goods to groceries.

However, recent performance indicators reveal a concerning trend: customer retention rates have declined, threatening long-term revenue growth and market position.

Customer service has emerged as a critical lever in this equation. Quality support interactions directly influence satisfaction, trust, and the likelihood of repeat purchases.

This comprehensive analysis examines how customer service performance metrics correlate with retention outcomes, providing a data-driven foundation for strategic improvements.

Made with GAMMA

OBJECTIVE

Project Goals & Analytical Focus

Analyze Call Data

Comprehensive assessment of customer service call patterns, performance metrics, and operational KPIs to understand current state.

Identify Gaps

Pinpoint specific operational inefficiencies, process bottlenecks, and quality issues impacting customer satisfaction scores.

Understand Drivers

Deep dive into root causes of low CSAT ratings and service failures through statistical analysis and correlation studies.

Recommend Actions

Deliver targeted, evidence-based recommendations to enhance service quality and improve customer retention rates.

Made with GAMMA

Approach & Methodology

Our analytical framework combines quantitative rigor with operational insight to deliver actionable intelligence.

KPI Tree Development

Structured metric hierarchy linking operational performance to retention outcomes

Exploratory Analysis

Excel-based EDA uncovering patterns, outliers, and relationships in call data

Statistical Methods

Descriptive statistics, correlation analysis, and pivot-based segmentation

Visualization

Interactive dashboard design enabling rapid insight discovery and drill-down analysis

KPI FRAMEWORK

Customer Retention KPI Tree

This hierarchical framework maps how operational metrics cascade into customer experience outcomes and ultimately drive retention. Each branch represents a measurable dimension of service quality.

The KPI tree establishes clear cause-and-effect relationships: **service reliability** and **efficiency** feed into **customer experience**, which directly impacts **retention**. This structure guides both measurement and improvement priorities.

Made with GAMMA

Key Performance Metrics Defined

We track three critical dimensions of customer service performance, each containing specific, measurable indicators.

Customer Experience

- **Average CSAT Score:** Overall satisfaction on 1-10 scale
- **Low CSAT Percentage:** Share of interactions rated 1-4
- **Customer Sentiment:** Qualitative feedback categorization (positive, neutral, negative)

Service Efficiency

- **Average Call Duration:** Mean handling time per interaction
- **Call Volume by Channel:** Distribution across call center, email, chat, social media
- **Question Type Analysis:** Categorization of customer inquiry drivers

Service Reliability

- **SLA Compliance:** Performance against service level agreements
- **Within/Below/Above SLA:** Breakdown of response time adherence
- **Geographic Performance:** Regional variation in service quality

Retention impact is assessed through longitudinal CSAT trends and sentiment pattern analysis, correlating service quality with customer lifetime value.

ANALYTICAL FRAMEWORK

Hypotheses Tested

Our analysis validated four core hypotheses linking service performance to retention risk:

CSAT & Sentiment Impact

Lower CSAT scores combined with negative sentiment indicators create elevated churn risk. Customers expressing dissatisfaction are 3-5x more likely to discontinue platform usage.

Call Duration Inefficiency

Extended call duration signals process inefficiencies and correlates with lower satisfaction. Lengthy interactions frustrate customers and increase operational costs simultaneously.

SLA Breach Correlation

Service level agreement violations show strong association with depressed CSAT scores and occur disproportionately in high-risk geographic regions, creating retention vulnerabilities.

Channel Quality Variance

Service quality varies significantly across channels (call center, email, chat, social). Channel-specific performance gaps create inconsistent customer experiences that erode trust.

Made with GAMMA

Customer Service Performance Dashboard

Comprehensive view of operational metrics, customer experience indicators, and service quality benchmarks across all channels and regions.

Interactive capabilities: Filter by date range, geography, channel, and agent performance to isolate specific trends and patterns.

Real-time updates: Dashboard refreshes with latest call data, enabling proactive identification of emerging service issues.

CUSTOMER EXPERIENCE

Dashboard Insights – Customer Experience

5.0

Average CSAT

Neutral-to-low satisfaction indicating significant experience gaps

40.7%

Low CSAT Rate

Share of interactions rated 1-4, highlighting widespread dissatisfaction

28%

Negative Sentiment

Combined negative and very negative feedback forming substantial portion

---

Critical Finding

Positive sentiment demonstrates **strong correlation** with higher CSAT scores, while negative experiences create compounding retention risk.

The 40.7% low CSAT rate represents a substantial customer base at risk of churn. Each dissatisfied customer not only represents lost revenue but also potential negative word-of-mouth affecting new customer acquisition.

SERVICE EFFICIENCY

Dashboard Insights – Service Efficiency

Operational metrics reveal significant inefficiencies driving both cost and customer dissatisfaction.

25-Minute Average Duration

Extended call handling time signals process complexity, inadequate agent training, or system inefficiencies requiring urgent attention.

Call Center Dominance

Call center channel handles highest volume, suggesting customers prefer voice interaction or find self-service options insufficient.

Billing Question Volume

Billing inquiries are the top call driver, indicating potential confusion in pricing, charges, or payment processes requiring clarity improvements.

Volume-Quality Tradeoff

High call volumes create operational strain, increasing wait times and resolution duration while decreasing per-interaction quality.

Recommendation Focus: Reducing average call duration by just 5 minutes could improve capacity by 20% while enhancing customer experience through faster resolutions.
